

Tick Tubes®

How It Works:

-  Lyme Disease is spread by **infected deer ticks**, which use **mice** as their courier to get from place to place. Contrary to popular belief, the mouse is the original target, not the deer.
-  Tick tubes kill off deer ticks using a technique much like Frontline on dogs and cats. Mice use the treated cotton balls in Tick Tubes for their nesting habitat, which coats their fur with an insecticide. **When a tick tries to feed on the mouse, the tick is killed.** The mouse goes unharmed.
-  Protect the mouse, and the disease will not spread to you, your family, and your pets. **With an early spring this season, ticks will be out in high numbers!**

Proven Results:

Reduces the risk of getting infected by a diseased tick by 97%
